EDUCATION

New Jersey Institute of Technology

Bachelor of Science in Computer Science

Newark, NJ

Sept. 2022 - Aug. 2025

CORE TECHNOLOGIES

Clinical Systems: Medidata Rave EDC, Rave Architect, Rave Amendment Manager, Medidata Custom Functions, eCRF Design, Edit Check Development, RTSM/IRT, UAT, Rave User Administration

Clinical Data Standards: CDISC SDTM, CDISC ADaM, Data Validation Specifications (DVS)

Programming & Analytics: SQL, SAS, Python, R, Pandas

Programming Languages: C#, Java, JavaScript

Tools: Git, Tableau, LLM API Integration (Claude, OpenAI)

PROFESSIONAL EXPERIENCE

Regeneron Pharmaceuticals

Associate Clinical Database Developer

Feb. 2026 – Present

Warren, NJ

- Built and validated 500+ clinical edit checks across 5 studies in Medidata Rave Architect using C#/Medidata Custom Functions, partnering with CRO teams to translate protocol requirements into production-ready validation logic.
- Designed and configured electronic Case Report Forms (eCRFs) and clinical databases in Medidata Rave EDC, driving study startup timelines and ensuring accurate, protocol-compliant data collection.
- Managed post-production database changes via Rave Amendment Manager (Migrations, Quick Publish) and supported RTSM/IRT setup, AE/SAE alert configuration, and Rave User Administration across study builds.
- Led User Acceptance Testing (UAT) efforts to validate edit checks, database functionality, and data workflows ahead of study go-live.
- Applied SAS, R, and Python for clinical data validation and quality assurance, working cross-functionally with data management and statistical programming teams.

B The Cause

Backend Software Engineer Intern

June 2025 - Aug. 2025

Newark, NJ

- Led backend and database development for a 4-engineer team, building a REST API (Laravel/PHP) and optimizing MariaDB queries and indexing to improve data-tracking performance for an education analytics platform.

New Jersey Institute of Technology

Undergraduate Research Assistant

Jan. 2024 - May 2024

Newark, NJ

- Built Python and Pandas ETL pipelines to process 10,000+ athlete records, reducing manual data preparation from 8 hours to 15 minutes.
- Performed statistical analyses using PostgreSQL and Python to identify injury risk factors, presenting findings through data visualizations that informed training decisions.

FEATURED PROJECTS

Clinical Study Diagnostics Engine (TrialGrid Recreation)

Python, Claude API, Excel/openpyxl

- Rebuilt TrialGrid's EDC study validation engine in Python, implementing 128 diagnostic rules as individual functions across categories like Build Quality, Naming, and RaveX compatibility, with the Claude API parsing Architect Loader Spreadsheet inputs into structured data for rule evaluation.

Clinical Trial SDTM/ADaM Mapping | Repository

SAS, Python, CDISC SDTM & ADaM Standards

- Mapped raw clinical trial data to SDTM domains (DM, AE, VS) and derived an ADaM ADSL dataset using [SAS/Python], following CDISC SDTM Implementation Guide standards and controlled terminology, using CDISC Pilot Project data.

Sports Data Engineering & Analytics | Repository

Python, R, scikit-learn, Tableau, GitHub Actions

- Built an end-to-end analytics pipeline for multi-season NBA and European football datasets using automated ETL workflows and statistical models (random forest, lasso regression, clustering) across 450+ players and 100+ teams, applying the same statistical programming and validation approach used in clinical data analysis.

Job Application Intelligence Platform | Repository | Website

Django, React, PostgreSQL, Auth0, OpenAI API

- Built a full-stack platform with automated document parsing (PDF/DOCX) and a PostgreSQL data layer, serving 30+ production users — demonstrating structured-data validation and database design skills.
